MAYDAY USER INSTRUCTIONS

The Mayday is a discrete boost inspired by a classic 60's treble booster circuit. At its core, this pedal utilizes a single silicon transistor to boost your guitar's signal and provide a subtle but natural texture. This pedal preserves the greatness of the treble boosters before it, but also improves upon the design with modern amenities such as: standard center-negative power, a silicon transistor for consistent tone in all environments, and voicing flexibility.

BOOST : Controls the overall volume of the boosted signal.

VOICE : Toggles between three different voicing options: treble (center), mid-range (up), & full range (down).

This pedal is powered with a standard, center-negative 9V power supply. Daisy chain power supplies are not recommended. For the best user experience, an isolated power supply is recommended for powering all Awestruck Amplification pedals.
